Acknowledgements

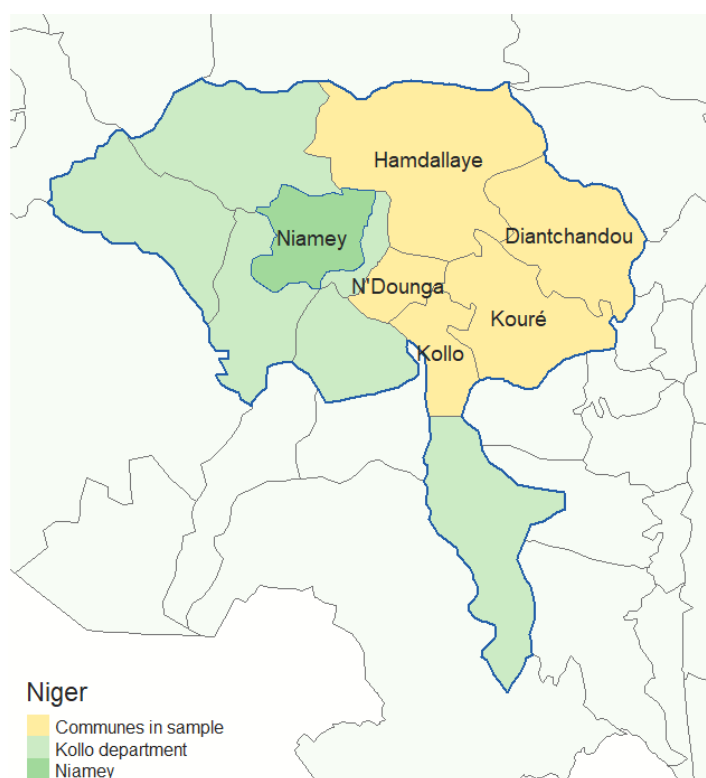

Fafo takes the opportunity to express its sincere gratitude to all those who have participated in the undertaking and contributed to the success of the study of ‘Impact of the Covid-19 shock on school-aged children with disabilities in rural Niger’. In particular we are grateful to Université Abdou Moumouni, Ecole Normale Supérieure (ENS) for conducting the fieldwork for the survey with a high level of commitment and professionalism. ENS Survey’s team was headed by Professor Nana-Aicha Goza Sandi, while Mamane Inoussa coordinated the technical part of the training and assisted during fieldwork in Niger. Many thanks also to PhD student Yacouba Daouda who was responsible for the qualitative components of this project.

Fafo wishes to thank the Atlas Alliance in Norway for funding this important research. We are also grateful to Dan Firoun Mounkaila from the Fédération Nigérienne des Personnes Handicapées (FNPH) and Zarmia Abdoulaye Boukari from the Adventist Development and Relief Agency (ADRA).

Most importantly we wish to thank the people in Niger for their kind cooperation in responding to the survey. It is our hope that the results of the survey will help national planners and international donors understand the hardship of life during the pandemic, and the challenges of everyday life.

Introduction

This tabulation report presents the results from a panel survey conducted in 2019 and 2022 by The Faflo Institute for Labour and Social Research and the Université Abdou Moumouni, Ecole Normale Supérieure (ENS) Niger. The survey targeted two groups of school-aged children (7–16 years): Children with disabilities (CWD) and non-disabled neighboring children of the same age and gender. The children and their households lived in five communes in the Kollo department of western Niger (yellow area on map).

In total, 551 children with disabilities (CWD), 550 peer children, and one caregiver for each child were included in the survey. The first round of data collection was conducted between September 2018 and March 2019, and the second round was conducted in July 2022.

The 551 CWD and their caregivers were included in the survey through a community-based key informant method (KIM). In 2019, a key informant in each village was trained to identify children who might potentially have disabilities. Pediatricians made home visits to 2191 children out of the 2561 children identified by the key informants as possible CWD. After an initial assessment, the pediatricians proceeded to complete the Washington Group screening form for 1154 of the children. Based on the screening, the pediatricians identified 597 children as having moderate/severe vision, hearing, physical or intellectual impairments, epilepsy, albinism, or

emotional distress. Among them, 551 children were able and willing to participate in our survey. See Banks et al (2022) for a detailed description of the KIM methodology as well as estimates of the prevalence of disabilities in Niger.

To compare the CWD with children with similar social characteristics, we identified four children of similar age and gender in each of the CWD children’s neighborhoods and randomly selected one among them. When there were fewer than four children of the same age and gender in the CWD’s neighborhood, we relaxed the requirement on age. In this way, we identified 551 peer children, one for each CWD participating in the survey. There was an age difference of up to two years between 392 pairs of the CWD and the peer children. One peer child refused to participate in the survey, but we did not replace this child. Therefore, in the final sample, we have 550 pairs of CWD and peer children, and one CWD with no peer child. In addition, the sample includes one caregiver for each of the 1101 children.

In 2022, we traced the 551 CWD and 550 peer children that were interviewed in 2019. In total, we re-interviewed 465 CWD and 419 peer children in 2022. Among them, there were 360 pairs from 2019. We also interviewed 496 caregivers of CWD and 455 caregivers of peer children in 2022. The statuses of the interviews in both surveys are shown in Table 1.

When the child and/or their caregiver could be found, field researchers conducted an interview about the child. If the child was incapable of responding by him/herself, the caregiver responded on the child’s behalf. Caregivers responded on behalf of 39.6 percent of the CWD and 17.4 percent of the peer children. Caregivers assisted the child in responding for 28 percent of the CWD and 12.2 percent of the peer children. In addition to the child questionnaire, interviewers asked caregivers questions about his/her experiences and assessments as well as the situation and experiences of the household.

Among the 465 CWD visited in 2022, 26 have an emotional impairment, 200 have a musculoskeletal impairment, 36 have a vision impairment, 113 have a hearing impairment, 280 have a cognitive impairment, and 55 have epilepsy. One hundred and twenty-five CWD have two impairments, and 55 have three or more impairments.

If the children were not available or refused to participate, we asked for information from persons that may know the children, including relatives or neighbors, the key informants in 2019, village chiefs, religious leaders, and so on. These people responded to a short questionnaire in order to identify what had happened with the child. Short questionnaires were completed for 211 children who could not be re-interviewed in 2022.

Table 1 Interview status

	Child				Caregiver			
	CWD		Peer		CWD		Peer

Not interviewed		83	1	128	1	54	7	92
Refused		2	1	1				
Dead		24		6				
Not available		57		121				

In both the 2019 and 2022 surveys, we collected information about the children's time allocation for working, studying, and leisure activities; education; perceptions of social inclusion, current life, and future prospects, etc. In 2022 we added questions about the children's and their households' exposure to risks during the pandemic period, such as food insecurity, harmful work, and begging, and children's exposure to maltreatment in school and village. The household questionnaire included questions about household properties, caregivers' and other household members' social inclusion and exposure to the risks during the pandemic period, and so on. The short questionnaire used to interview relatives and others about children who were not available featured questions about the unavailable children's residence location, school enrollment, working status, marital status, and some information about the parents and previous caregivers of the children.

The content of the report

The remainder of this report presents tables with results from the 2019 and 2022 surveys. The results are divided into fifteen chapters. Chapter 1 provides data on responses and characteristics of the sample (gender, age, schooling status, marital status, etc.) in both years. Chapter 2 contains tables on education-related characteristics of the children, such as the history of schooling and capability of reading and writing in French and doing mathematics calculations. Chapter 3 presents data about the time allocation of the children for work-related, study-related, and leisure activities. Chapter 4 provides information on children's reported exposure to maltreatment in villages and schools in 2022. Chapters 5 and 6 focus on the social inclusion of the children and their families. Chapter 7 is about the influence on children of other persons with disability. Chapter 8 presents information on the children's households, parents, and caregivers. Chapter 9 contains information about household properties and access to financial resources. Chapters 10 and 11 focus specifically on food security among children and their households during the pandemic period. Chapters 12 and 13 contain tables on the perceptions of current life conditions and futural prospects among the children and their caregivers. Chapter 14 is about the health conditions of the children. Chapter 15 describes the reported prevalence of certain drastic strategies the children or other household members resorted to during the pandemic period.

The tables

Tables 1.1, 1.2, and 1.3 are presented with two background variables (CWD or peer children, communes) at the top of the table and a few main variables in the rows below. Column percentages are presented in the three tables for each of the main variables over categories of the background variable. Frequency distributions of the main variables are shown in the last column.

All the other tables in this report are presented with the main variable and year of data collection (in parenthesis) at the top of the table and selected background variables in the rows below. Data regarding the CWD and peer children are presented separately. The top row of the table is always the percentage distribution of the main variable without any background variable sorting. Percentage distributions of the main variable by different background variables are presented below the Total row. Percentages are based on the row totals in the last column. In cases where multiple responses are allowed, the percentages may add up to more than 100 percent. Data

from 2019 and 2022 are presented in separate tables with the year of data collection specified in the title.

Note: The question was asked in different ways depending on whether or not the child was in school. For children who were not in school, we asked 'Does the child generally have to stay home?'. For children who did go to school, the question was 'Does the child generally have to stay home when he/she is not in school?'.

Children with disabilities during Covid-19: Survey Data from rural Niger in 2019 and 2022

This tabulation report presents the results from a panel survey conducted in 2019 and 2022 by The Fafo Institute for Labour and Social Research and the Université Abdou Moumouni, Ecole Normale Supérieure (ENS) Niger.

The survey targeted two groups of school-aged children living in Western Niger: Children with disabilities (CWD) and non-disabled peer children. In addition, we collected information about the children's caregivers and households. The survey reached almost all children with moderate and severe disabilities in a rarely-studied and severely underdeveloped area. It provides unique information about the situation of the children and their households before and after the Covid-19 pandemic, and enables comparison with non-disabled peer children. This tabulation report presents 227 tables with descriptive results regarding the children's and their households' education, health, social inclusion, maltreatment, time allocation, perceptions of life and future prospect, and risks and coping strategies related to the Covid-19 pandemic.
